
Exit lag ou wtfast crack is a type of cycling sport in which two riders ride on cycle tracks with different gaps between them. The sport originated in the Netherlands but it has since spread around the world. It is typically timed where races are half or full laps with speeds that range from 30 to 45 miles per hour. The name can be broken down phonetically to "exit-lag-ou-weight-fast", which means riding at a speed fast enough to gain time on your opponent provided they have not finished their lap before you have crossed the finish line. In other words, if you exit a corner faster than your opponent, it will take longer for them to catch up to you provided you have successfully crossed the finish line. It originated in Holland. The first races were held in the town of Oudewater where they still hold a race each year. The course is a flat course with multiple turns and allows for a lot of physical contact between the racers. Some courses have short sections which are unpaved and have sand or gravel on them allowing riders to lose traction due to being bumped by another rider or from going off the course into the sand or gravel. A common strategy used by riders is to elbow their opponents and use physical contact to force them into a turn and maintain their lead. The main governing body of the sport is the Fédération Internationale de Cyclisme (International Cycling Federation). There are usually two or three classes that determine how fast a rider can go. The first class is usually amateur and is for people who never competed professionally before. The second class is usually semi-pro, where the rider gets an amount of time to train and compete before they might be able to make it professionally. The third class is for professional riders. A professional rider will be a person who has a contract with a company and they get paid for each race they do. The levels of the races that people enter into are determined by how fast they are. A rider's speed can also be determined from their age group or by what event they have been assigned to. The other way to determine how good someone is in Exit lag ou wtfast crack is based on how fast they go around the track. They determine this using a system called average speed, which is determined by taking the total time it took to complete a full lap and dividing it by the number of laps completed. The weight varies depending on the track and can range from 250 to 350 grams. The weight is made of carbon fiber and is anodized. The use of a cycling helmet and pads is mandatory in all races and often times gloves and shoes are also required. There is no minimum amount that a rider must wear because it is up to the governing body that oversees that specific track to decide what they want their riders to wear. As of 2018, the rules have changed on who can race in different categories. The new rules are based on age instead of speed. People under the age of 18 have one set set of rules, adults have another set, and anyone over the age of 18 has one last set. They are all still the same except on how many laps were done in each category.
